Key Vocabulary Terms from Chapter 14

Below is a detailed review of essential vocabulary terms from Chapter 14, along with their definitions and explanations.

1. Gene

A gene is a segment of DNA that codes for a specific protein or functional RNA. Genes are the basic units of heredity and are passed from parents to offspring, influencing traits and characteristics.

2. Allele

An allele is an alternative form of a gene that arises by mutation and is found at the same place on a chromosome. Different alleles can produce variations in inherited traits.

3. Dominant and Recessive Alleles

- Dominant Allele: An allele that expresses its phenotype even when only one copy is present. - Recessive Allele: An allele that only expresses its phenotype when two copies are present.

4. Homozygous and Heterozygous

- Homozygous: An organism with two identical alleles for a particular gene (e.g., AA or aa). - Heterozygous: An organism with two different alleles for a gene (e.g., Aa).

5. Genotype and Phenotype

- Genotype: The genetic makeup of an organism; the specific alleles inherited. - Phenotype: The observable physical or physiological traits of an organism resulting from the genotype.

6. Punnett Square

A diagram used to predict the outcome of a genetic cross by combining the alleles of the parents to determine possible genotypes and phenotypes of offspring.

7. Homozygous Recessive and Homozygous Dominant

- Homozygous Dominant: Carry two dominant alleles (e.g., AA). - Homozygous Recessive: Carry two recessive alleles (e.g., aa).

8. Law of Segregation

A fundamental principle stating that during the formation of gametes, the two alleles for a trait separate so that each gamete carries only one allele for each gene.

9. Law of Independent Assortment

States that the alleles for different genes segregate independently of one another during gamete formation.

10. Pedigree

A diagram that shows the inheritance patterns of traits through multiple generations of a family.

Common Questions and Their Answers from the Vocabulary Review

Here are some typical questions students encounter related to Chapter 14 vocabulary, alongside detailed answers to aid understanding.

Q1: What is the difference between a genotype and a phenotype?

A: The genotype refers to the genetic makeup of an organism—specifically, the alleles inherited for a particular trait. The phenotype is the physical expression or observable trait resulting from the genotype. For example, a genotype might be Aa, while the phenotype could be brown eyes.

Q2: How do dominant and recessive alleles influence inheritance?

A: Dominant alleles mask the effect of recessive alleles when present. If an organism inherits a dominant allele, it will display the dominant trait. Recessive traits only appear when an organism inherits two recessive alleles, one from each parent, making it homozygous recessive.

Q3: What is a Punnett square, and how is it

used?

A: A Punnett square is a grid that helps predict the possible genotypes of offspring from a particular cross. It involves placing the alleles of each parent along the top and side of the grid and filling in the squares to see all potential combinations.

Q4: Explain the Law of Segregation with an example.

A: The Law of Segregation states that during the formation of gametes, the two alleles for a gene separate so each gamete carries only one allele. For example, if an organism has the genotype Aa, half of its gametes will carry A, and the other half will carry a.

Q5: What is the significance of pedigrees in genetics?

A: Pedigrees help trace the inheritance of traits through generations, allowing geneticists to determine whether traits are dominant or recessive, and to identify carriers of certain genetic conditions.
