management.

Core SysML Diagrams for Spacecraft Architecture

To effectively utilize SysML in spacecraft design, engineers should familiarize themselves with its core diagram types, each serving specific purposes within the modeling process.

Block Definition Diagrams (BDDs)

BDDs are fundamental for defining system components (blocks) and their relationships. They establish the hierarchy and modular structure of the spacecraft architecture.

1. Define major subsystems such as Propulsion, Power, Thermal Control, and Communications.
2. Specify block properties, interfaces, and inheritance for specialized components.

Internal Block Diagrams (IBDs)

IBDs illustrate how components within a system are interconnected and interact.

between subsystems.

2. Identify potential bottlenecks or points of failure.

Requirement Diagrams

Requirement diagrams link system requirements to design elements.

1. Trace high-level mission objectives down to specific subsystems.
2. Ensure all requirements are addressed during design and verification.

Parametric Diagrams

Parametric diagrams enable analysis of system performance parameters.

1. Model relationships between variables such as thermal loads, power consumption, and structural stresses.
2. Facilitate optimization and trade-off studies.

Sequence and Activity Diagrams

These diagrams depict operational scenarios and workflows.

1. Simulate mission sequences, such as deployment or

maneuvering procedures.

2. Identify timing constraints and potential conflicts.

Best Practices for Architecting Spacecraft with SysML
