Her work often emphasizes the importance of integrating basic science with clinical applications, aiming to improve patient outcomes through innovative research.

Core Concepts in Maji Jose Oral Biology

Oral Tissue Anatomy and Physiology

Understanding the anatomy of oral tissues is fundamental to grasping how they function and respond to various stimuli. Key tissues include:

1. Enamel: The hardest tissue in the human body, protecting the teeth from wear and

decay

2. Dentin: The porous tissue beneath enamel that transmits sensory signals
3. Pulp: The soft tissue containing nerves and blood vessels
4. Gingiva: The gum tissue supporting the teeth
5. Periodontal ligament: Connects teeth to alveolar bone, facilitating movement and shock absorption

The physiology of these tissues involves complex cellular interactions, signaling pathways, and responses to injury or infection.

Molecular and Cellular Mechanisms

Maji Jose's research often highlights the importance of understanding cellular signaling pathways involved in tissue maintenance and repair. Key molecular players include:

1. Growth factors such as BMPs (Bone Morphogenetic Proteins) and TGF- β (Transforming Growth Factor-beta)
2. Stem cells in dental pulp and periodontal ligament
3. Extracellular matrix components like collagen and proteoglycans
4. Gene expression patterns associated with tissue regeneration and disease progression

Advances in molecular biology techniques have enabled researchers to manipulate these pathways for therapeutic purposes.

Microbiology and Oral Ecosystem
